This is the 5' sequence of the clone insert
Clone from S. Wiemann, Molecular Genome Annalysis, German Cancer
Research Center (DKF2); Email 8. Wiemann@dkfz-heidelberg.de;
sequenced by BMFZ (Blomedical Research Center at the Heinrich-
Heine-University, Duesseldorf/Germany) within the cDNA sequencing
consortium of the German Genome Project. No 81 sequence available.
This clone (DKF20778X1758) is available at the RZPD in Berlin.
Please contact the RZPD: Ressourcenzentrum, Heubnerweg 6, 14059

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

421

New polynucleotides and polypeptides, useful for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy.

Claim 1; Page; 222pp; English

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed its a polypeptide encoded by the polynucleotide, an antibody binding to the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polynucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide, or as a probe for detecting the polynucleotide and encoded is useful as paramaceutical agents and many diseaser-related proteins are useful as pharmaceutical agents and many diseaser-related proteins are useful as pharmaceutical agents and many diseaser-related proteins for regulation of their expression and activity, or as targets of genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, disease-related proteins and genes cncoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The cDNA may be used to requlate the activity or expression of the encoded protein to treat diseases. The sequence data for this patent is not represented in the printed special passed on sequence information supplied by the

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

Claim 20; SEQ ID NO 58354; 103pp; English.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recading (IR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cartivity of (II) as useful in gene therapy techniques to restore normal cartivity of (II) are useful for genes. (I) is useful in gene therapy techniques to restore normal continuity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful in medical imaging colypeptide and polymucleotide sequences have applications in disorders of some mapping, identification of mutations cand to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the winter of the sequences of the invention of marker in the printed specification, but was obtained in the winter of the printed specification, but was obtained in the winter of the commat directly from MIPO at the confidence.

```
The present invention relates to human single exon nucleic acid probes (SENP): see AAIIO06-AAI20459). The present sequence is a peptide encoded by one such probe. The SENPS are derived from human Hela cells. The SENPS can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical ancer. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GGACATGGAGATGGACAAAGCTCAGAGAAAGCCCCTGAGGTTTCTCACACAAAAAAA 321

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                               Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21353-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GAGGTGTCCAAAACGGTGGTCAGCAAGACTTACGAGAGGAGGGGACGTGAGCCACCTC 381
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            562 AGCGTAGACACAGAGGACAGCGGCTATGGAGGAGGCTGAGGAGAGGCCCGAGCAGGAT 621

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphona, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 81 SerGluLeuThrLysGlyTrpArgValMetGluGluGluGluGluProThrTrpArgSerAsp 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           561

They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements fragments). The probe hypridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidemia and hypercholesterolaemia which is sesociated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                            561

The present sequence is a polypeptide encoded by one of a large number of s' ESTB derived from mRNAs encoding secreted proteins. The 5' ESTB were tissues. ESTB derived from 30 different tissues. ESTB sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTB are not well suited for isolating cDNA primed cDNA libraries. Such ESTB are not well suited for isolating cDNA longer cDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTB are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. S' ESTB are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

human secreted proteins, and encode the proteins given in AAX1933 for human secreted proteins, and encode the proteins given in AAX11533 to AAX11679, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokins activity, call and therapy. The proliferation/differentiation activity, haematopoiesis regulating activity, tassue growth regulating activity, reproductive hormone regulating activity, receptor/ ligand activity, haemostatic and thrombolytic activity, chemotactic/ chemokinetic activity, haemostatic act bring thrombolytic activity, chemotactic/ ligand activity, anti-inflammatory can be used in forensic, gene therapy and chromosome mapping products. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide into a cell of a polypeptide into a cell
                                                                                                                                                                                            ic acids encoding human secreted proteins - obtained from cDNA derived from liver, lung, large intestine, colon, thyroid and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         47
                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABIJ6176-ABIJ6511), expressed DNA aequences (ABIJ6175) and the encoded proteins (ABB57137 ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences

The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI208459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs and be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                         Peptide #8059 encoded by probe for measuring cervical gene expression.
                                                                                                                   Probe; human; microarray; gene expression; cervical epithelial cell;

The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                     260 AAGGACATGGAGATGGACAAAAGCTCAGAGAAAGCCCCTGAGGTTTCTCACATCAAAAAGA 319

LOCATION:
LOCATION:
LDENTIFICATION METHOD: DNA sequencing and restriction analysis
OTHER INFORMATION: 1: is the encoded product of nucleotide SEQ ID NO:
OTHER INFORMATION: 1: is the enzyme, GDP-L-fucose- -D-galactoside 2-alpha-fuc
OTHER INFORMATION: which has the amino acid sequence described in SEQ. ID NO:
OTHER INFORMATION: is responsible for the synthesis of 2'-fucosyllactose.
PUBLICATION INFORMATION:
AUTHORS: V.P. Rajan, et al.

Patent No. 5750176
GENERAL INFORMATION:
APPLICANT: Prieco, P., Smith, D., Cummings, R., Kopchick, J., Mukerji, P.,
APPLICANT: Moremen, K., Pierce, J.
TITLE OF INVENTION: Transgenic Production of Oligosaccharides and
TITLE OF INVENTION: Glycoconjugates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ORGANELLE:
